PROJECT 07 / WEB DEVELOPMENT

Ismail Studio

A WordPress Service Website with a Working Inquiry Desk

Independent software project | Owner: Ismail Habib | Created September 2026

Actual application capture. Any example records are labeled verification inputs.

The problem

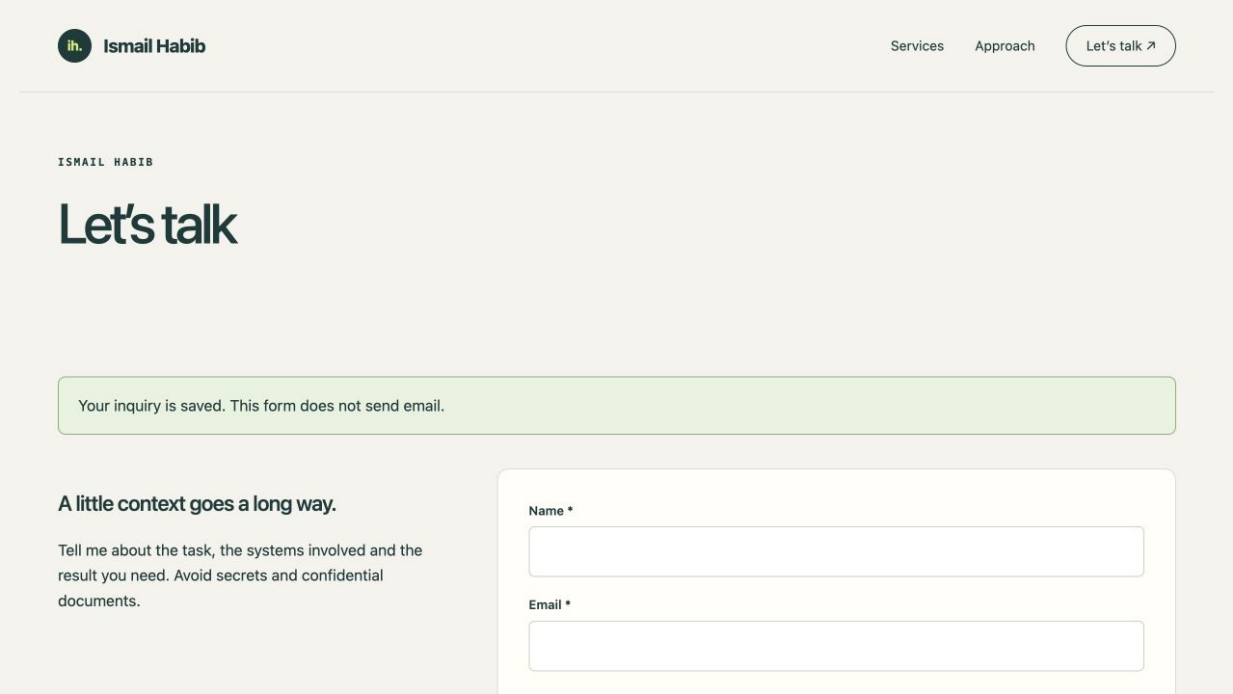

A service website needs to do more than explain capabilities. A visitor's inquiry must reach a usable staff record, with clear validation, truthful confirmation and a manageable follow-up process. This independent project connects the public website to that complete local workflow.

What the project delivers

- Responsive custom WordPress theme and service pages
- Validated inquiry form with local database persistence
- Authenticated staff inbox, review status, CSV export and deletion
- Installable packages plus a lightweight Python/SQLite runtime

ENGINEERING & EVIDENCE

Built to be inspected.

Actual WordPress confirmation after saving a clearly labeled test inquiry. No email or customer interaction is implied.

What was verified

Executed in real WordPress 7.1.2 using official container images. All 8 WordPress integration checks passed, including form protection, saved inquiry, authenticated inbox, review state, CSV export and deletion. The separate Python runtime passed 4 integration tests for pages, validation, persistence, escaping and the staff workflow. Tests used labeled synthetic input and removed it afterward.

How it works

Visitor to Validated form to Database to Staff review to Export or delete

Current scope

A newly built independent project, not a historical client engagement. Verified locally and not publicly deployed. The form stores inquiries and does not send email. No conversion, revenue or adoption claims are made. The Python staff inbox is loopback-only and has no login. Public deployment requires appropriate hosting, HTTPS, access controls, traffic protection and a site-specific privacy and retention policy.

Included: source code, setup guide, tests, screenshots, editable case study and Malt copy.
